

In the ceramics and advanced classes all lessons utilize technology with no lesson be only about technology. Ceramics and the use of clay is an ancient use of practical arts that evolved through aesthetics to include the ceremonial through to the personal and humorous. Technology has also evolved from when clay was fired by wood in pits to computerized kilns with various times and heating specifications. Each lesson in the curriculum requires students to research, whether it's the use of their cell phone, the library computers, or their own home computers. They have utilized pinterest, instagram and specific clay demonstrations on you tube. With each lesson the chemical changes that clay and glaze undergo to result in hardened clay with glass surface is a practical and observable use of technology as it applies to their specific project.
