

Technology Piece – Using Drag and Drop

The new technology I used was having the students open a document which consisted of terms which were inside text boxes and definitions which were numbered. The students had to drag and drop each term underneath each correct definition. They students practiced using drag and drop while practicing terms for the chapter they are learning.

Drag and Drop

STEPS:

1. In Microsoft Word type a list of definitions in a numbered list, and on another page type each term into a text box (I colored each text box).
2. Click start, computer and double-click studentapps. Once in studentapps, make a new folder with your class name.
3. Copy the word document you made into the folder with your class name on studentapps.
4. When students come to class have them go to studentapps and open the document to work on the assignment using drag and drop.

*Students can only open documents that are saved in studentapps, they cannot save there. If you want them to save the document they would have to click file, save as and save it under their own name
