

Technology

Lesson application in Ceramics program.

In an earlier submission I documented that the use of the kiln in bisque and glaze firing served as an example of technology that has developed and changed over centuries but in its current state is a new process for students to learn.

In this latest submission I am documenting that every lesson relies on the use of visual references for brainstorming and historical associations. Some use the slide projector but more contemporary examples are on the computer on students' phones and on YouTube. If they need access they are sent to the library for the use of media. Some use these images printed out for direct decorative features while others use a reference in its entirety.
